## **Ensuring the Sustainability of Retrofits**

Will Swan  
Director  
Energy House Laboratories

# Introduction

---

- About Energy House Labs
- Retrofitting for Energy Efficiency
- Energy Transitions
- Risks and opportunities
- Conclusions

# Labs

---

University of  
**Salford**  
MANCHESTER

# What is retrofit and has it changed

---

- Warm Homes, Greener Homes
- Low Carbon Innovation Report
- CERT, CESP
- Green Deal
- Building Regs - Consequential Improvements
- GDHIF
- ECO

## But still remains...

---

- Fabric, systems, controls improvements – behaviour  
Carbon Emissions
- Fuel Poverty
- Energy System Security and Resilience

# Energy Efficiency – Saint Gobain (2013-4)

Full Retrofit

Full Retrofit without  
Floor Insulation

Solid Wall Insulation

Performance  
Glazing

Loft Insulation

Reference

Acoustic Test

## Discussions around...

---

- Quality and standards (PAS2030/ 2035)
- Supply chains – install and O&M
- **Financing**
- Warranties, liabilities, planning, charges etc.
- Occupants and handover
- Technological choices and building pathology
- Ever shifting policy
- Differences in tenure – OO/ PR

## ...however there are changes

---

- Energy efficiency
  - Storage and renewables
  - Smart systems
  - Electrification – heat and transport
- 
- There are new issues that retrofit needs to take account of the energy transition

# Measuring vs modelling

- Assessing properties using smart meter data – how do we know how things are really performing?
- Rather than relying on EPC data, could use real performance data
- Surveying still needs to be done

# Smart Energy Systems – HAVEN (2019)

---

- Smart Energy System within the Energy House
- Multiple assets under control
- Generating, storing, and consuming energy

## This might mean...

---

- Possible income streams through...
- Demand Side Response
- Trading
- Virtual Power Plants
  
- Could this be a way to plug a retrofit funding gap?
- NEDO/ Homes as Energy Systems

## Energy House 2

---

- New facility
- 2 large scale chambers
- Weather conditions covering 95% of world's population
- Multiple building types
- New energy vectors

# Conclusions

---

- Old truths of good retrofit still hold true
  - energy efficiency is still best practice
- Fast changing energy system is creating new risks and opportunities
- New systems, new business models
- Data is useful, but still needs interpretation
- However, we need to think carefully about impact on occupant

# Questions?

---
