

# Development Brief

#### An Urban Leisure Centre

- 25m competition swimming pool
- 20m community pool
- Children's confidence/play water
- Health and fitness centre (150 gym station and flexible studio)
- Café
- Children's soft play activity space
- Spa (including hydrotherapy pool, heat experience and treatment room)
- Rooftop terrace
- Environmental factors
- Contract = £35m

### Triple Bottom Line Approach

### Triple Bottom Line Approach

### St Sidwells Point

First Passivhaus Pool & Leisure Centre In the UK Energy/Water reduction Energy – 70% Water – 50%

Healthy building Air, Water quality Comfort and radiation

Climate Ready Comfort Rainfall Storm severity

### Pools – what's the difference?

- High energy and water use
- Range of different temperature zones in one building
- High temperature levels (32 C) means pools need to be heated all year
- High humidity and chemicals create challenging environment for materials and building fabric

# Case for Passivhaus, Climate Resilient & Healthy Leisure Centre

Passivhaus (energy)	Climate Resilient	Healthy
Passivhaus design ensures all energy uses are accounted for	Ensures good summer comfort without compromising energy performance	Ultra filtration and low chemical water treatment ensures healthier water quality and reduces risk of asthma
Outcome based performance parameters = reliable, scientifically proven energy savings	Business case assumptions delivered even when climate changes	High levels of comfort and water quality will increase user satisfaction and is expected to increase customer numbers
Reliable energy performance and running costs ensure economic viability and project delivers on business case assumptions	Low water use strategies reduce energy demand, costs and ensures resilience during droughts	High quality ventilation provides filtered outdoor air reducing indoor air contamination from particulates
	High quality air filtration maintains air quality and protects from increase in contaminates from particulates and pollen under future climate scenarios	Higher levels of natural light and human- centric/circadian lighting design promotes health and customer satisfaction

### The Passivhaus Pool Concept

A Passivhaus building envelope will significantly reduce heating energy losses in pool buildings and results in the following benefits:

- Higher surface temperatures
- Minimum thermal bridging avoiding condensation risk
- Increased thermal comfort

![](_page_7_Picture_6.jpeg)

![](_page_7_Picture_7.jpeg)

### The Passivhaus Pool Concept

But these are **just the starting point** to unlock further energy savings:

- Higher relative humidity possible throughout the year (~64%)
- This will reduce evaporation rates from pool water and reduce required ventilation rates (ventilation rate of 1-1.5 ac/h with no re-circulation)
- More economic ventilation/ducting (eg glazed façade elements don't need to be ventilated to protect from condensation.)
- Reduced electrical energy demand for ventilation

100%	
Total Energy Demand

![](_page_9_Picture_0.jpeg)

### Energy

#### Solution

- High levels of insulation
- High performance windows, doors and curtain walling
- Compact building form
- Optimum solar orientation
- Optimised thermal bridges
- Highly efficient MVHR systems
- Internal thermal zoning
- Increased relative humidity to pool areas
- Waste energy from cooling system for heat
- High levels of airtightness

# Climate Ready Design

#### Context

- The climate is changing
- Majority of buildings constructed today will still be in use during the 2<sup>nd</sup> half of this century, performing under considerably different conditions
- Climate ready design increases resilience, extends useful life and economic viability
- Implementation from the outset will reduce long-term maintenance and energy costs
- Does not necessarily result in increased capital costs

![](_page_15_Picture_8.jpeg)

![](_page_15_Picture_9.jpeg)

![](_page_16_Picture_0.jpeg)

# Climate Ready Design

#### Criteria

- Adaptable
  - To meet future weather scenarios without compromising energy use or healthy building principles
- Optimised
  - Optimise design to consider future weather scenarios *and* current ones

![](_page_16_Picture_7.jpeg)

![](_page_16_Picture_8.jpeg)

![](_page_16_Picture_9.jpeg)

![](_page_17_Picture_0.jpeg)

# Climate Ready Design

#### Solution

- Design for Comfort
  - Designs thermally modelled using IES and probabilistic future weather data from the Prometheus Project (2030, 2050, 2080 50<sup>th</sup> percentile high emission scenario)
- Water Management
  - Reduce water demand (50% reduction) and improve resilience to flooding (30% contingency)
- Construction
  - Detailing developed to cater for increased storm severity, increased driving rain and changes in ground water level

![](_page_17_Picture_9.jpeg)

![](_page_17_Picture_10.jpeg)

![](_page_18_Picture_0.jpeg)

# Healthy Building

#### Context

- Water Quality
- 45min swimming lesson, a child swallows about a pint of pool water
- UK pools estimated 10-20 times higher parasitic infection than other EU countries
- Water normally treated with chlorine highly toxic
- Nitrogen trichloride layer above pool surface
- Sand filtration with 'flocculants'

- Radiation
- Human body controlled by weak
  electromagnetic fields
- Electrically charged particles in the body will align with external fields, oscillate and go into resonance
- Trigger stress response and symptoms
- Artificially generated EMFs or electrosmog will always affect life processes
- Static electric, static magnetic, ELF static, ELF electric, radio frequency

#### • Air Quality

- Some agents still used in general UK construction have been classified by the WHO as 'carcinogenic' (1) or 'potentially carcinogenic' (2B)
- Including: formaldehyde, benzene, polychlorinated biphenyls
- Most VOCs typically found in modern paints, glues and timber treatments are in the same category as tobacco smoke (1)

![](_page_18_Picture_19.jpeg)

![](_page_18_Picture_20.jpeg)

![](_page_19_Picture_0.jpeg)

# Healthy Building

### Solution

- Water Quality
- Ultrafiltration
- No chemicals required (aside from cleaning)
- Compact plant size
- Capable of achieving 90-100% pathogen removal
- UV treatment used in combination with ultrafiltration

- Radiation
- Following IBN best practice guidance to reduce EMFs
- Radial wiring
- Consider positions of cable runs and sockets
- Avoid two-way switches, looped lighting connections and dimmer switches
- Hardwired data and telephone connections

- Air Quality
- Material specification reflecting best practice guidance (IBN)
- Reduce off-gassing and indoor air pollutants
- Offices and crèche natural or mineral building products specified
- Areas ventilated via CO2 controlled mechanical ventilation set to 800ppm as advised by IBN

![](_page_19_Picture_20.jpeg)

![](_page_19_Picture_21.jpeg)

#### Training and Mock ups

![](_page_20_Picture_1.jpeg)

![](_page_20_Picture_2.jpeg)

- Training delivered by Warm
- Subcontractor training 'Passivhaus Passport'
- Early engagement of Warm and the supply chain
- Manufacturer training

![](_page_20_Picture_7.jpeg)

Mock up of critical building façade junctions

![](_page_20_Picture_9.jpeg)

![](_page_20_Picture_10.jpeg)

#### **Quality Management**

- Raising the standard
  Bridging the performance Gap
- Inspection & test plans
- Subcontractor early engagement
- Use of Snagmaster
  Platform
- Air Tightness Manager
- Training sessions
- Passivhaus
  Evidencing

#### Air tightness

![](_page_22_Picture_1.jpeg)

![](_page_22_Picture_2.jpeg)

ER

![](_page_22_Picture_3.jpeg)

- No air leakage
- PHI target 0.4 m3/(hm2) at 50Pa on this project verses 10m3/(hm2) at 50Pa to comply with building regs
- Smoke testing & thermal imaging checks to validate interface details and supplements the Quality Assurance process
- Less energy use to reheat/ cool internal spaces
- Improved end user comfort
