The "Decision Maker"

Modern Asset Management System

- Core 'Shell' which includes logon, security, permissions, 'people', data management, administration, setup, attachments, notes, reporting, comms, integration layer.

- Asset 'Core' Modules:
  - Groups, templates, assets, attributes.
  - Contract management.
  - Workforce management – internal and third party.
  - Task management – scheduled, ad hoc, reactive.

- Asset 'Optional' Modules:
  - Mapping integration.
  - Training information.
  - Safety and Hazard information.
  - RFID / NFC / Barcodes.

- Leasing – to combine asset, people, time and price.

- Receivables – to allow invoicing and cash collection.

- Booking – provide the ability for customer self service.

- Sounds great … but we need a solution now!
  - You can be up and running in 8 – 10 weeks … it can be as short as 2 weeks!
  - Phase the implementation as it is modular.
  - Prioritise the biggest benefits / wins.

- Sounds great .. but we are already too busy!
  - You are likely to have most of the data to hand – so let us do the data transformation.
  - Modern systems should be quick to learn and flexible in nature. This means you receive immediate pay back from time invested.

- Sounds great .. but we have budget pressure!
  - SaaS is priced per user / per month.
  - Allows you to start small and then scale.
  - Once implemented you can turn your assets into revenue generators.
