Summary

- Glasgow as a Living Lab Accelerating Novel Transformation (GALLANT)
- Community-scale energy
- Sustainable low-carbon energy
- Using Geographic Information Systems (GIS) to draw a coherent portrait of Glasgow's energy present and future
- Applying lessons learn on 'energy citizenship' from H2020 ENCLUDE

Glasgow as a Living Lab Accelerating Novel Transformation

Delivering a Climate Resilient City through City-University Partnership

£10.2m, NERC Changing the Environment, Jan 22 - Jan 27

***Leader of WP5: Sustainable Low-Carbon Energy at Community Scale
Executive Board Member***

WP1 Climate Resilient Urban Riverscapes

WP2 Social Benefits of Urban Biodiversity

WP3 Regenerating VDL via C-sequestration

WP4 Benefits of active travel & urban mobility

WP5 Sustainable Low-Carbon Energy at Community Scale

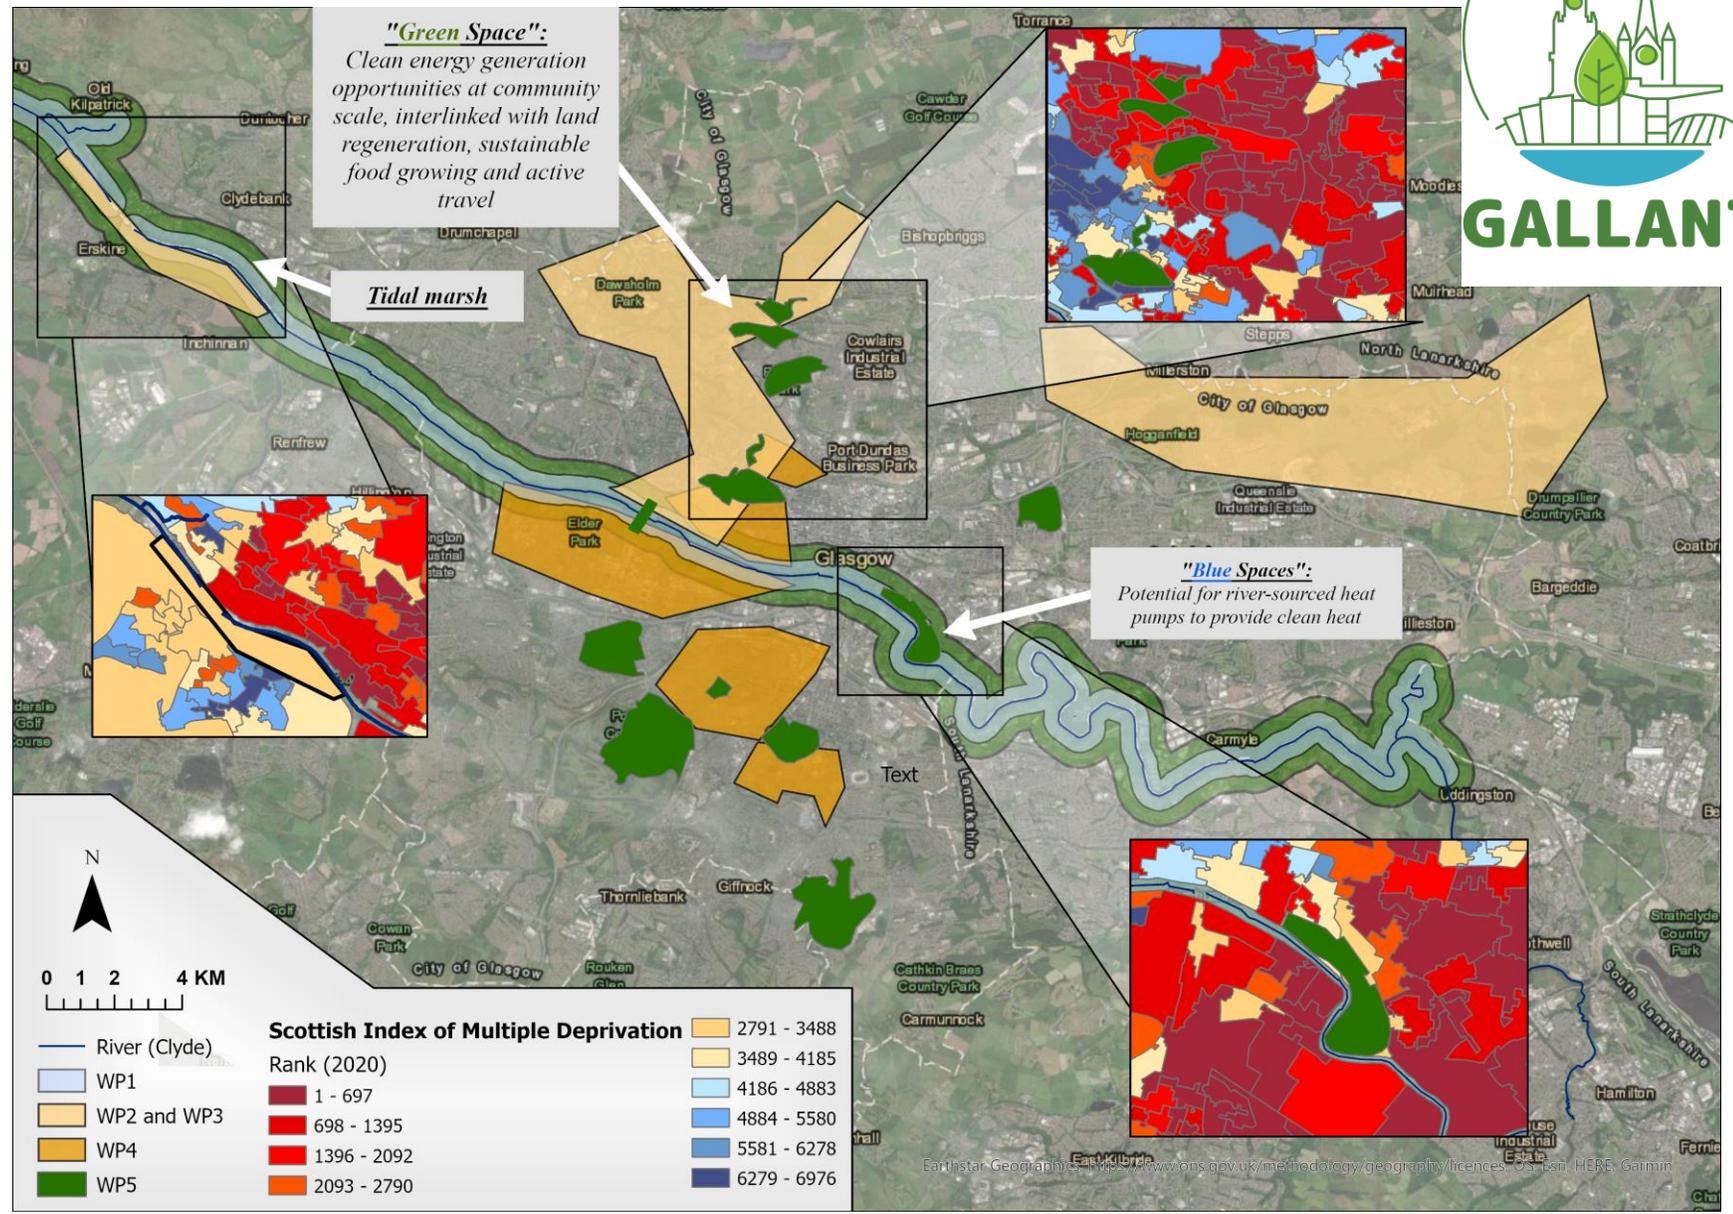

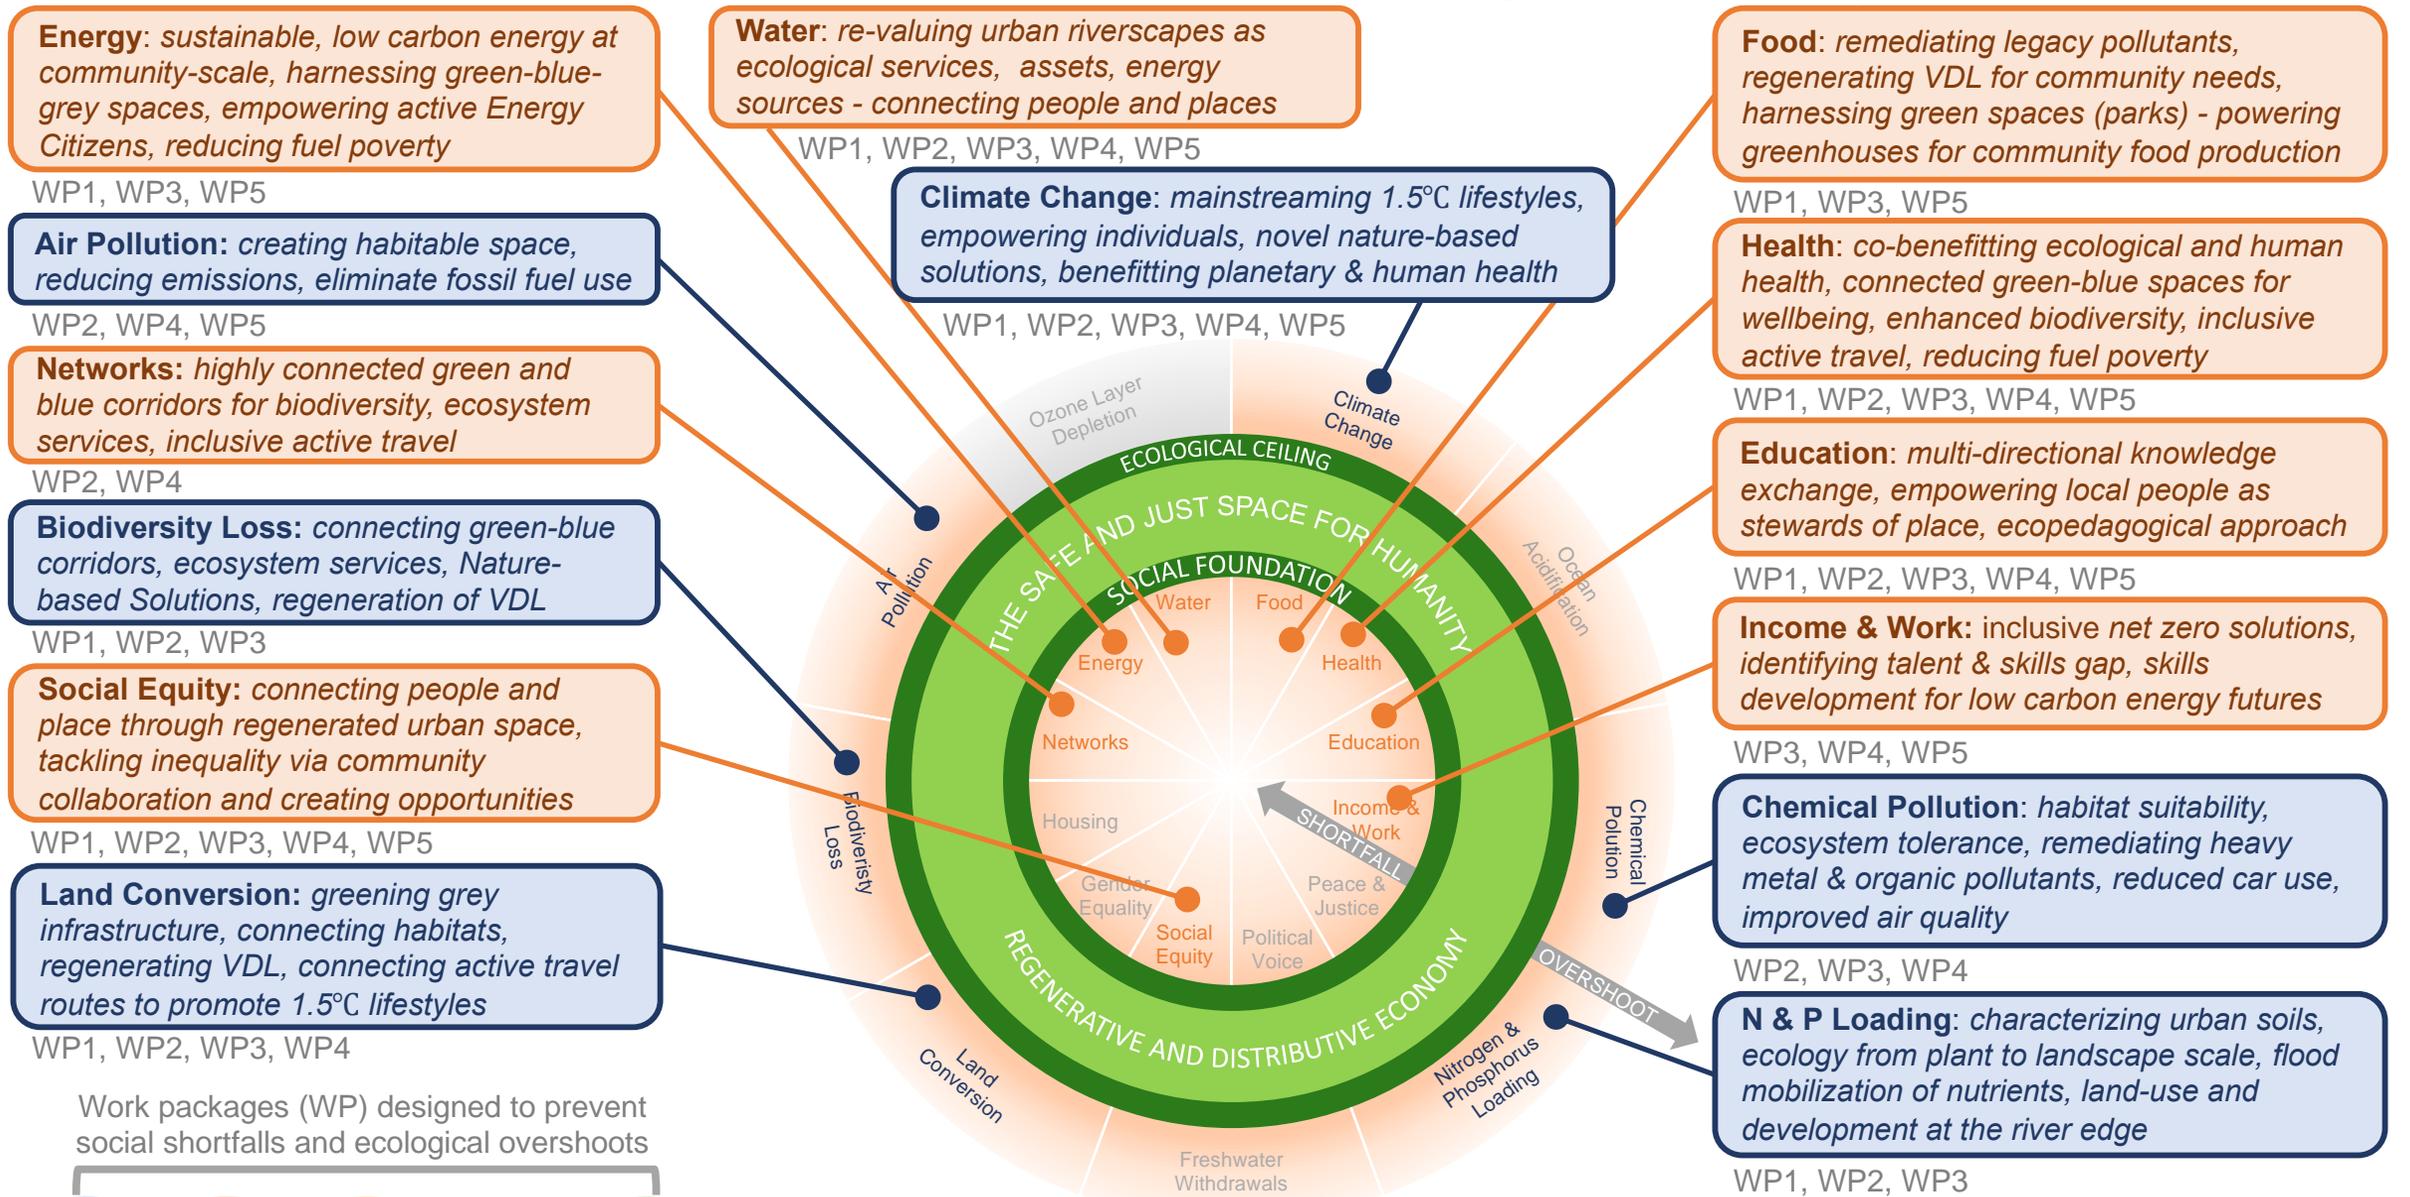

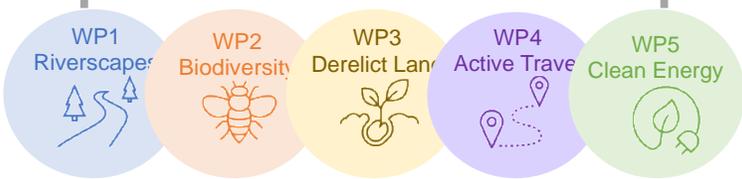

Figure 1. GALLANT's work in the context of the safe and just space between social and ecological boundaries (Doughnut Economics Action Lab, 2020)

Work packages (WP) designed to prevent social shortfalls and ecological overshoots

Embedded Workstreams: Systems, Communities, Data: System mapping, stakeholder & community co-designed value-based indicators for inclusive growth, data accessibility via a Virtual Data Hub. Multi-disciplinary expertise informing and accelerating meaningful, evidence-based decision-making and transformation.

Sustainable Low-Carbon Energy at Community Scale

Sustainable low-carbon energy solutions at community scale in urban **green** (parks), **grey** (VDL, cyclist/pedestrian bridges) and **blue** (Clyde) spaces.

...what is 'Community-Scale' Energy?

...what is 'Sustainable Low-Carbon Energy'?

What is 'Community-Scale' Energy?

Community-scale Energy:

Energy systems located in the same community. Ranges from a single neighbourhood with tens of buildings, to entire cities with hundreds of thousands of buildings.

(Flores et al., 2023)

- Scale vs. Ownership/Source of Funding
- Use (residential, commercial, mixed)
- Urban vs. Rural
- On-/Off-Grid
- Council Remit vs. Beyond
(emissions see no borders!)

Legal definitions of 'Energy Communities' at the EU level:

➤ Citizen Energy Community (CEC) Governance & Members

A legal entity that is based on voluntary and open participation, effectively controlled by shareholders or members who are natural persons, local authorities, including municipalities, or small enterprises, and micro-enterprises.

(EC, 2023)

➤ Renewable Energy Community (REC) Governance & Members

A legal entity that, in accordance with the applicable national law, is based on open and voluntary participation, autonomous, effectively controlled by shareholders or members that are located in the proximity of the renewable energy projects that are owned and developed by that legal entity; the shareholders or members of which are natural persons, SMEs or local authorities, including municipalities.

What is 'Sustainable Low-Carbon Energy'?

Country- and regional-scale indicators of sustainable energy

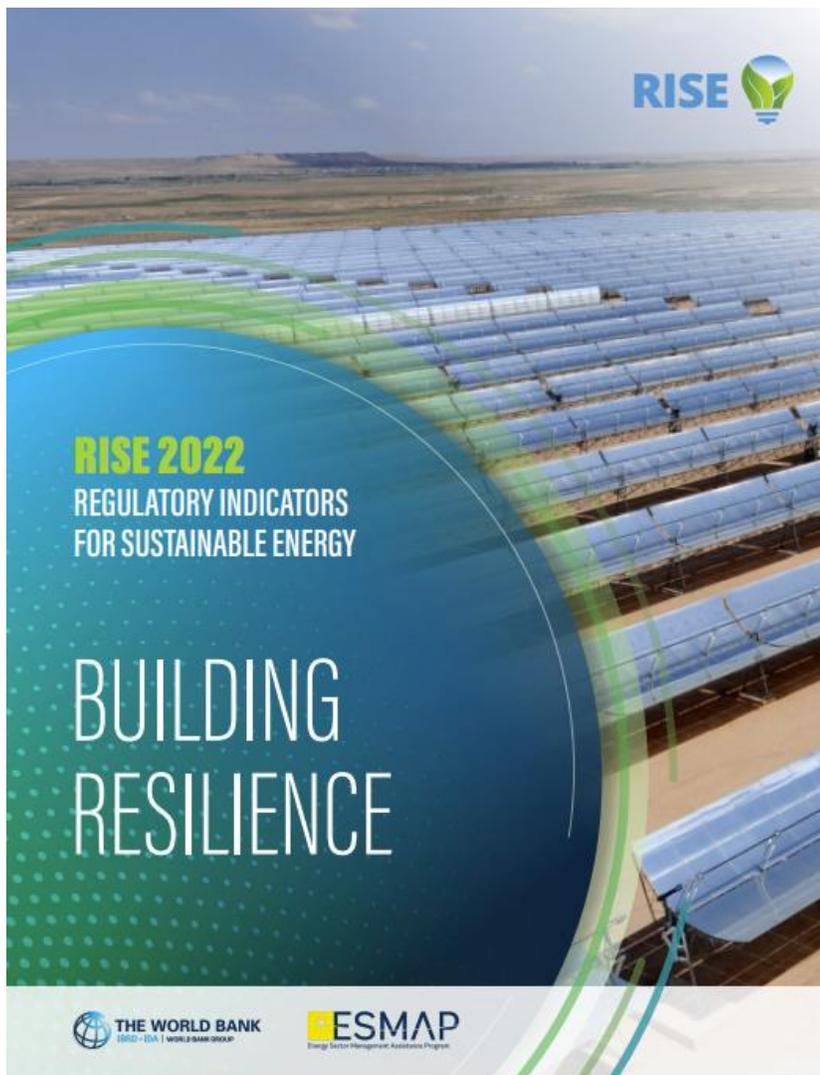

FIGURE 1. THE RISE FRAMEWORK: RISE'S SUSTAINABLE ENERGY PILLARS AND CORRESPONDING INDICATORS

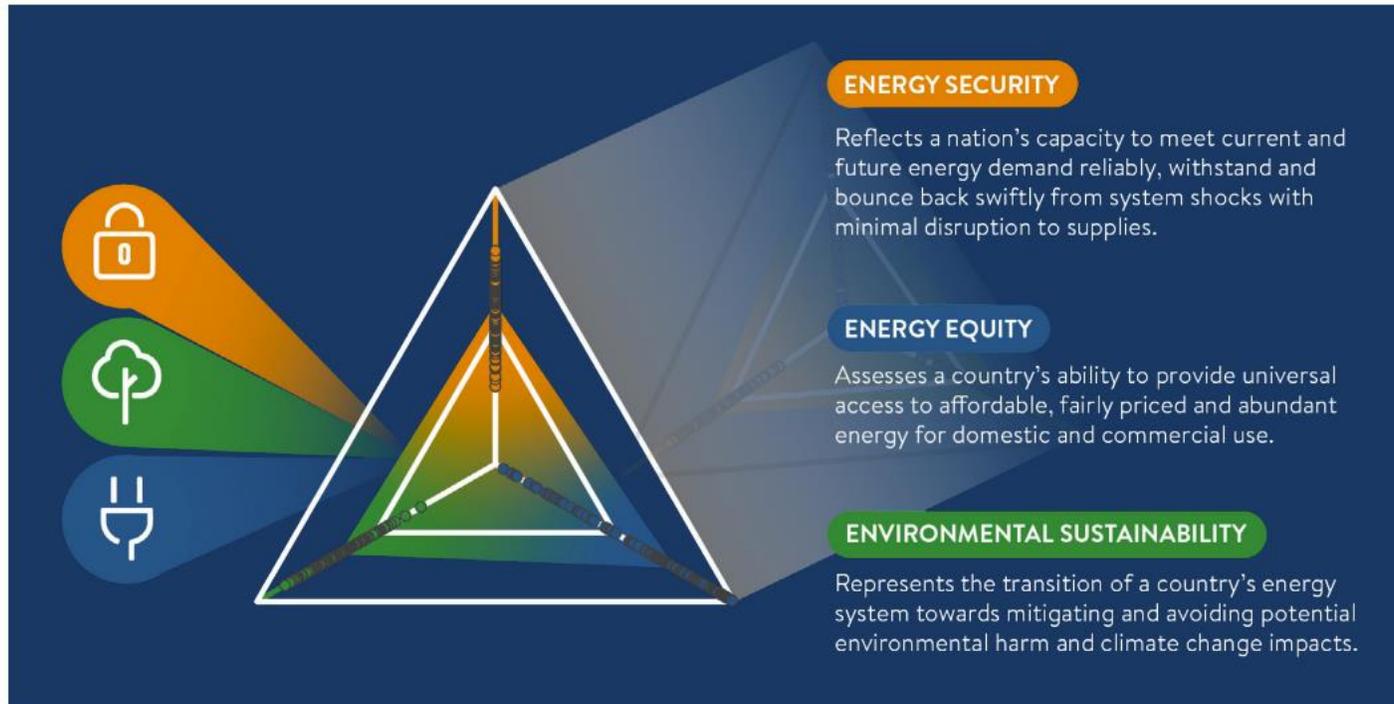

POLICIES AND REGULATIONS				
Pillar	Indicators			
 ELECTRICITY ACCESS	<ul style="list-style-type: none"> • Electrification planning • Scope of the electrification plan 	<ul style="list-style-type: none"> • Grid electrification framework • Framework for minigrids 	<ul style="list-style-type: none"> • Framework for off-grid systems • Consumer affordability of electricity 	<ul style="list-style-type: none"> • Utility transparency and monitoring • Utility creditworthiness
 CLEAN COOKING	<ul style="list-style-type: none"> • Clean cooking planning • Scope of planning 		<ul style="list-style-type: none"> • Standards and labelling • Financial incentives for clean cooking solutions 	
 RENEWABLE ENERGY	<ul style="list-style-type: none"> • Legal framework for renewable energy • Planning for renewable energy expansion 	<ul style="list-style-type: none"> • Incentives and regulatory support for renewable energy • Attributes of financial and regulatory incentives 	<ul style="list-style-type: none"> • Network connection and use • Counterparty risk 	<ul style="list-style-type: none"> • Carbon pricing and monitoring
 ENERGY EFFICIENCY	<ul style="list-style-type: none"> • National energy efficiency planning • Energy efficiency entities • Incentives and mandates: Industrial and commercial end users 	<ul style="list-style-type: none"> • Incentives and mandates: Public sector • Incentives and mandates: Energy utility programs • Financing mechanisms for energy efficiency 	<ul style="list-style-type: none"> • Minimum energy performance standards • Energy labeling system • Building energy codes 	<ul style="list-style-type: none"> • Transport sector energy efficiency • Carbon pricing and monitoring

Note: Indicators that were updated for the RISE 2022 survey are highlighted in red

What is 'Sustainable Low-Carbon Energy'?

Country- and regional-scale indicators of sustainable energy

(WEC, 2023)

(IAEA, 2005)

What is 'Sustainable Low-Carbon Energy'?

Project- and urban-scale indicators of sustainable energy

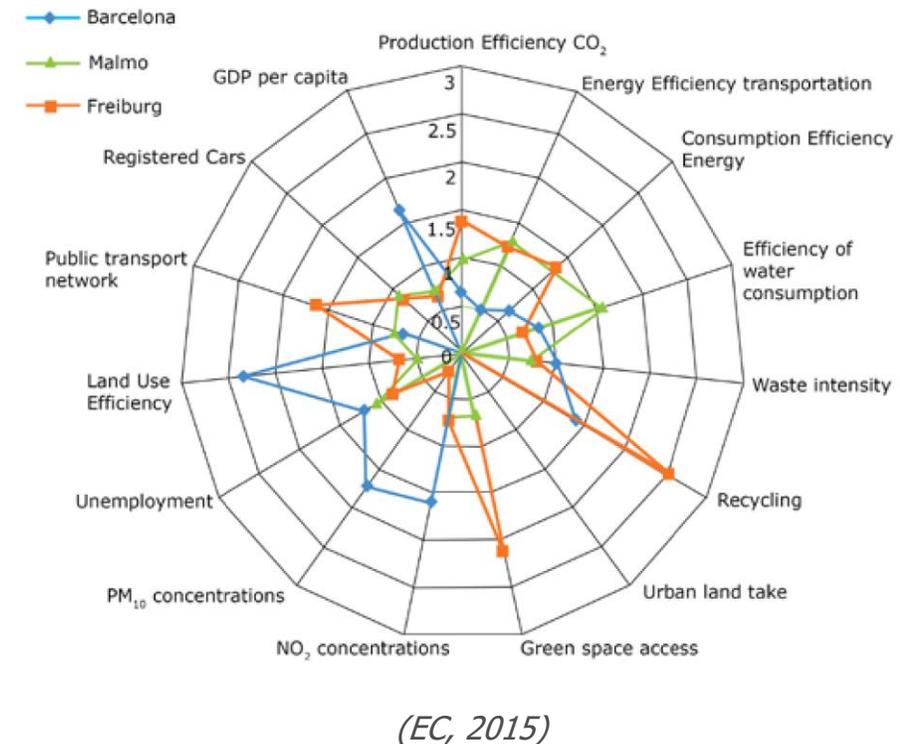

$$JC = \frac{\sum_{i=1}^I (JC_i \cdot t_i)}{P_{tot}}$$

where, JC represents the **number of jobs created** over the lifecycle of the project (jobs-y/Wh or jobs-y/J), JC_i is the number of jobs created during the life cycle stage i (years), t_i is the duration of employment in stage i (years), P_{tot} is the total energy generated over the asset life of the plant and I is the total number of lifecycle phases.

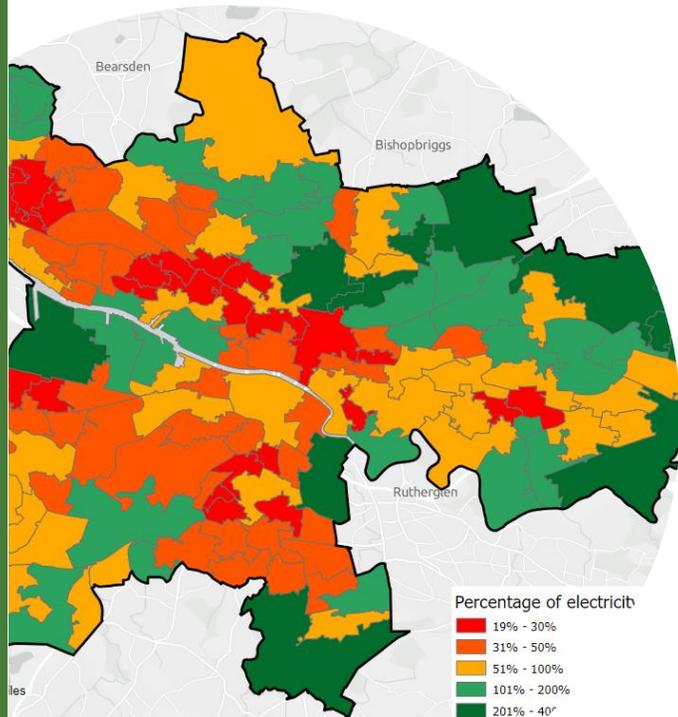

The impact of **land use** (ILU expressed in $\frac{m^2 \cdot y}{J \text{ or } Wh}$) of a plant is calculated as follows:

$$ILU = LA \cdot t_{LA}$$

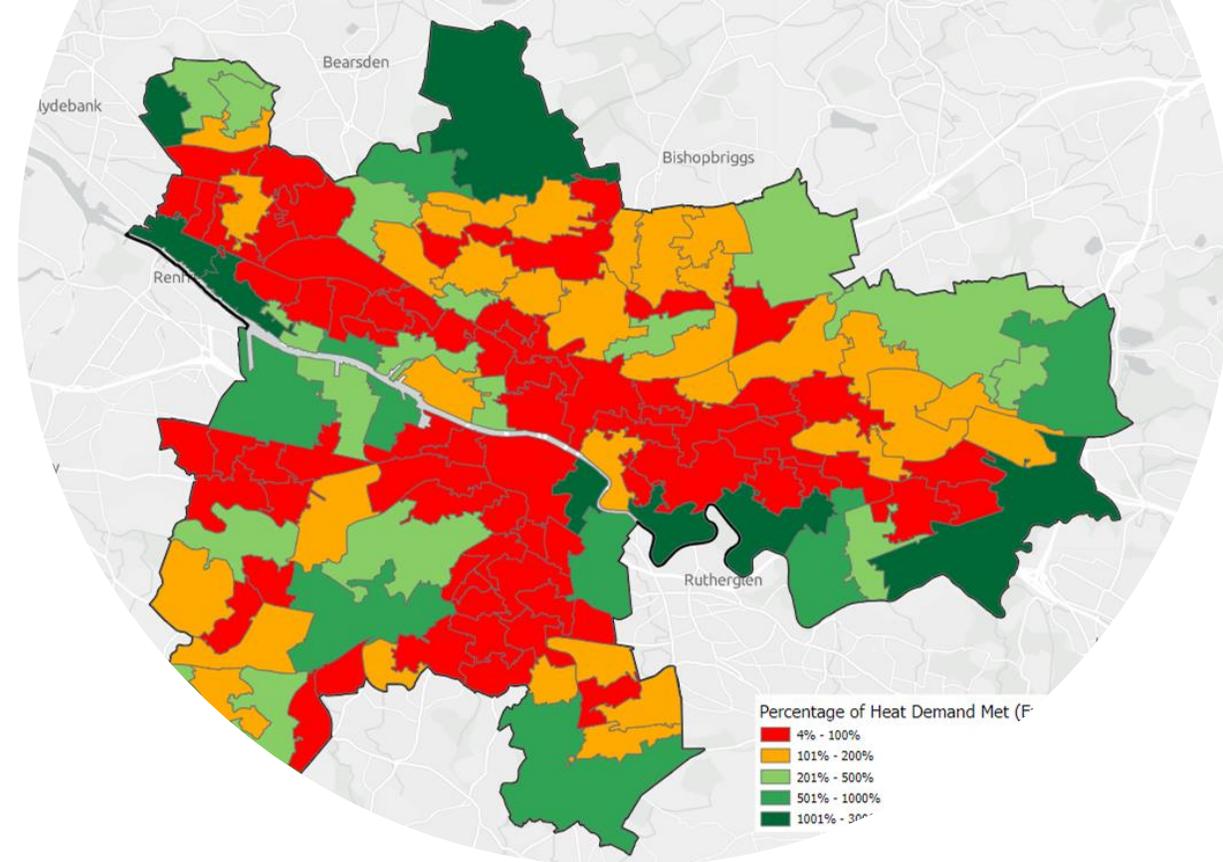

where, $LA(\frac{m^2}{J \text{ or } Wh})$ is the total land area required for the construction and operation of the project per unit of energy produced and t_{LA} is the amount of time that the land area is occupied by the project (y).

Can Glasgow survive on renewables?

(Tait & Falcone, 2024 – under review)

(Tait & Falcone, 2024 – under review)

Nicola Tait
GALLANT PhD student

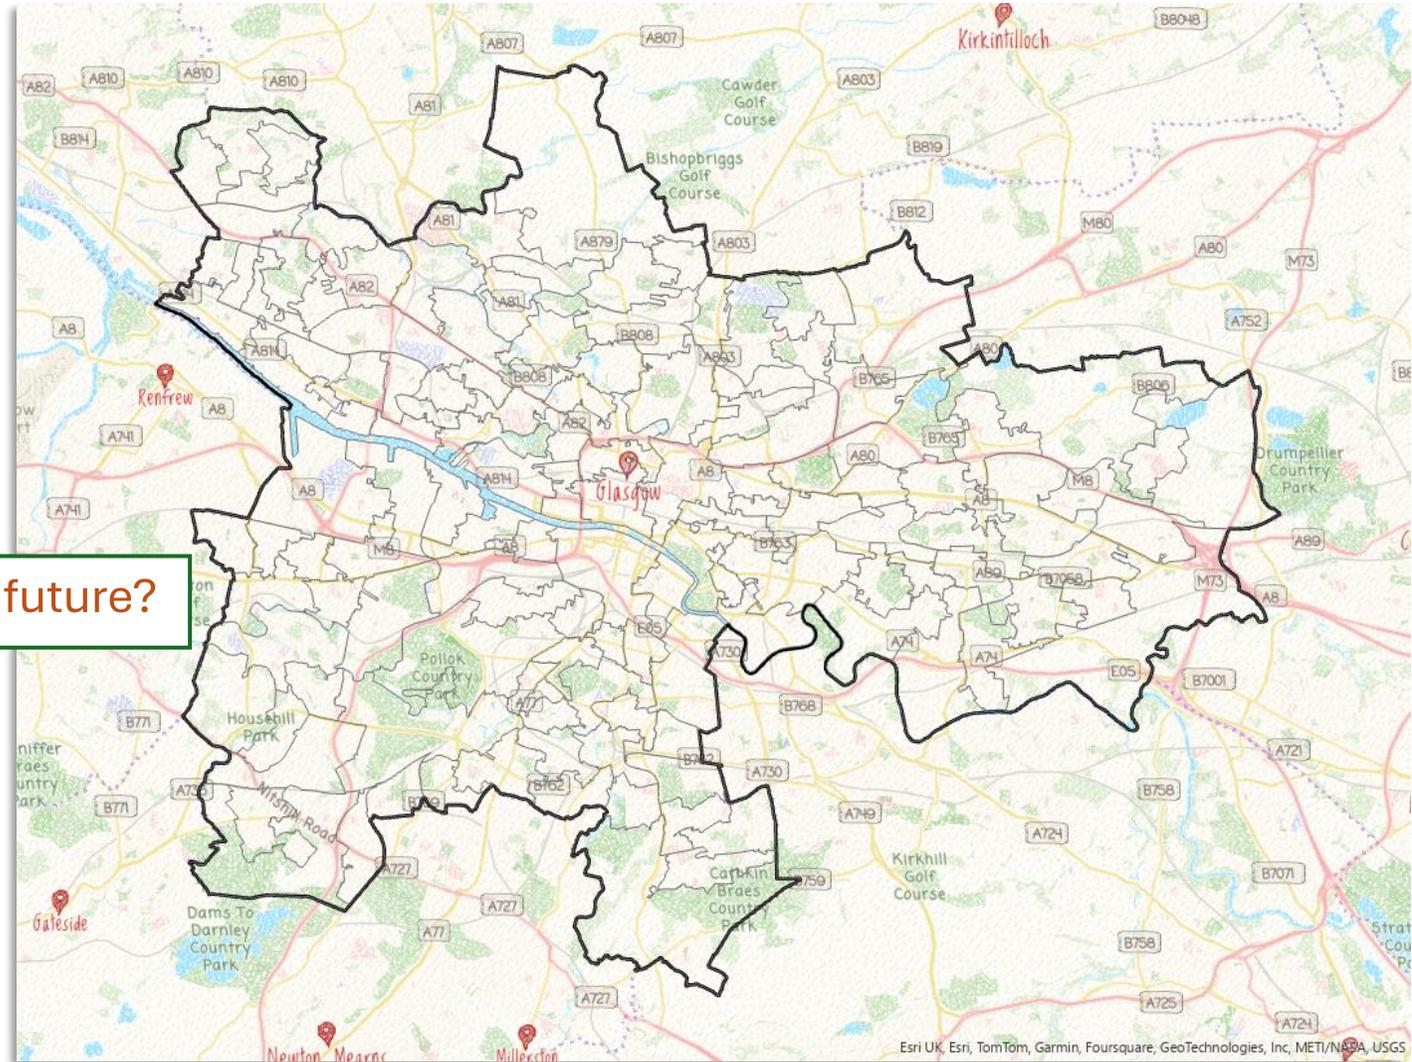

Supervised by:
GALLANT Co-Investigators Gioia Falcone and Siming You,
Principal Investigator Jaime Toney, and
Research Associate Graeme Hunt

Glasgow consumes around 2.4 TWh of electricity, 4.7 TWh of gas, 245 ktoe of road transport fuel, and 37 ktoe in other residual fuels each year.

How could this look like in a net zero future?

What resources do we have in Glasgow?

Alternative electricity generation in Glasgow

Glasgow recycling and renewable energy centre

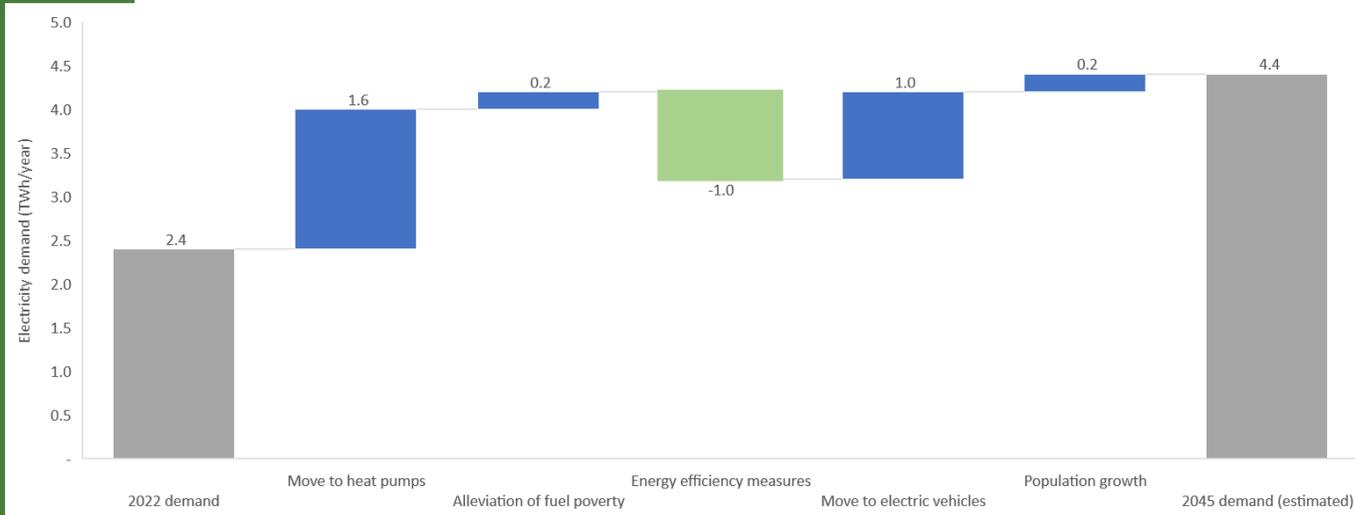

3 small wind turbines

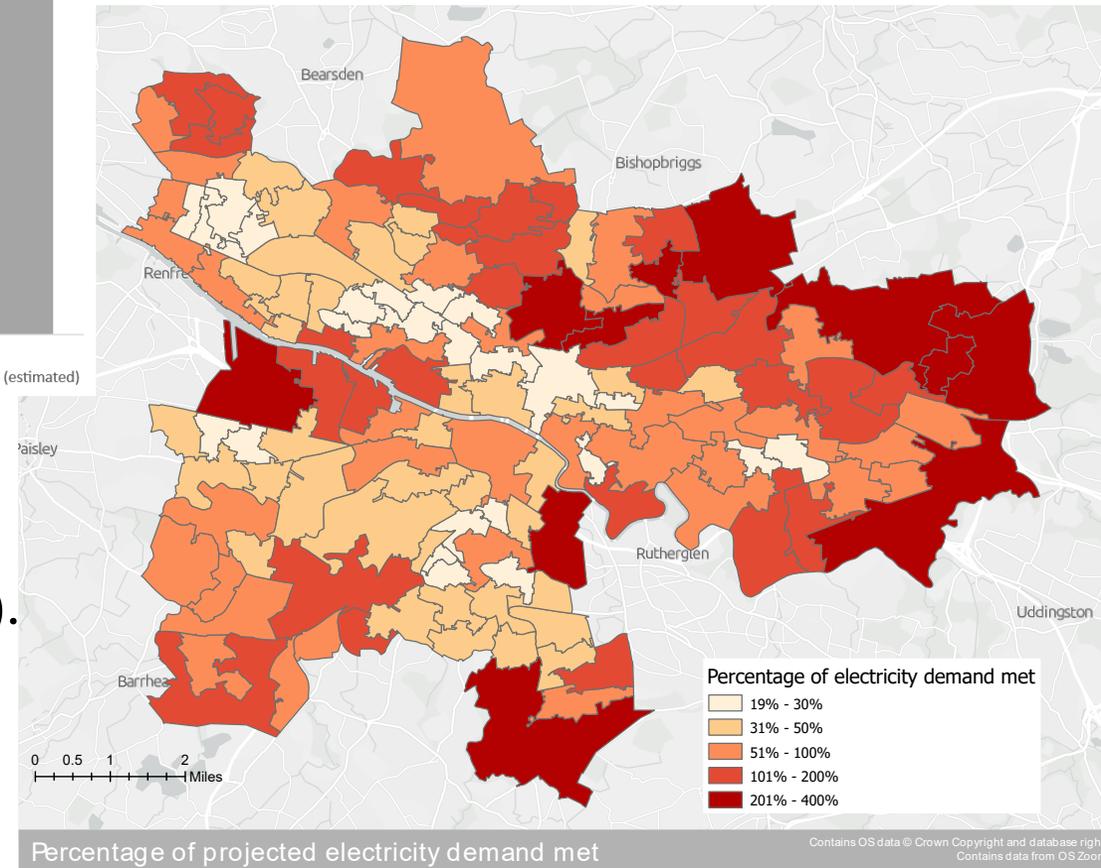

Source: IPCC and BBC
 Note: Values represent global averages for each fuel source. Incineration is for UK only. *The UK no longer generates electricity from coal.

Meeting electricity demand now/in the future

Resources available to generate electricity fall short at city level but may be sufficient to power new demand only (i.e., from heat pumps and EVs).

Alternative heat resources

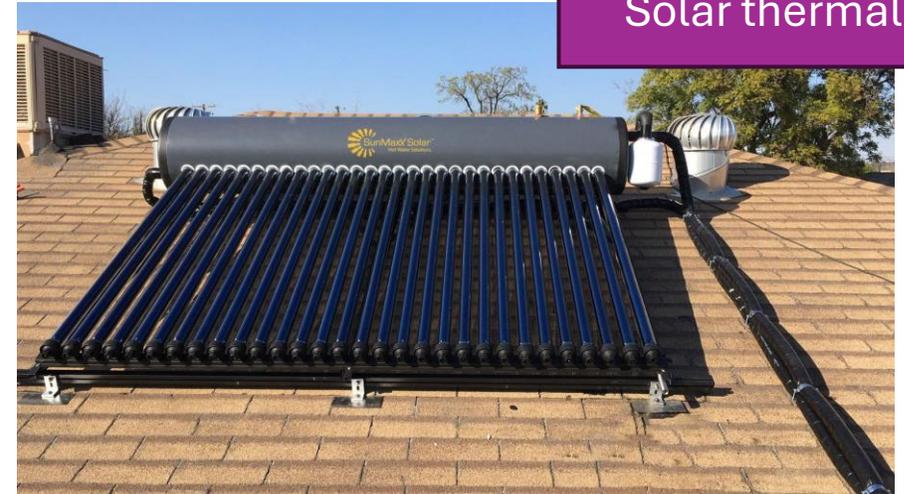

Water source heat pumps (rivers, ponds, wastewater network)

<https://www.houseplanninghelp.com/>

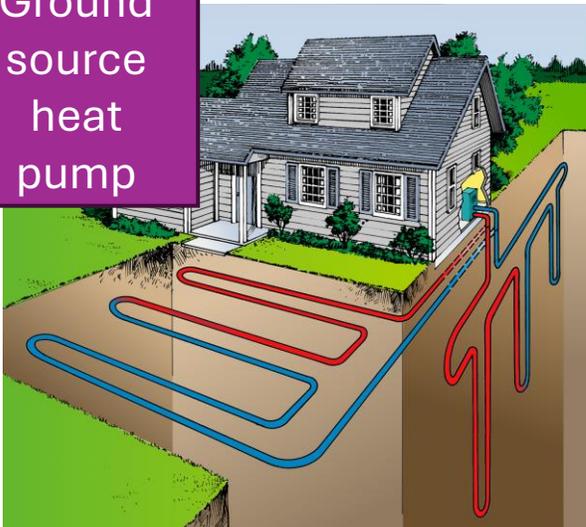

<https://www.acrjournal.uk/heat-pumps/>

Solar thermal

<https://www.sunmaxxsolar.com/>

Ground source heat pump

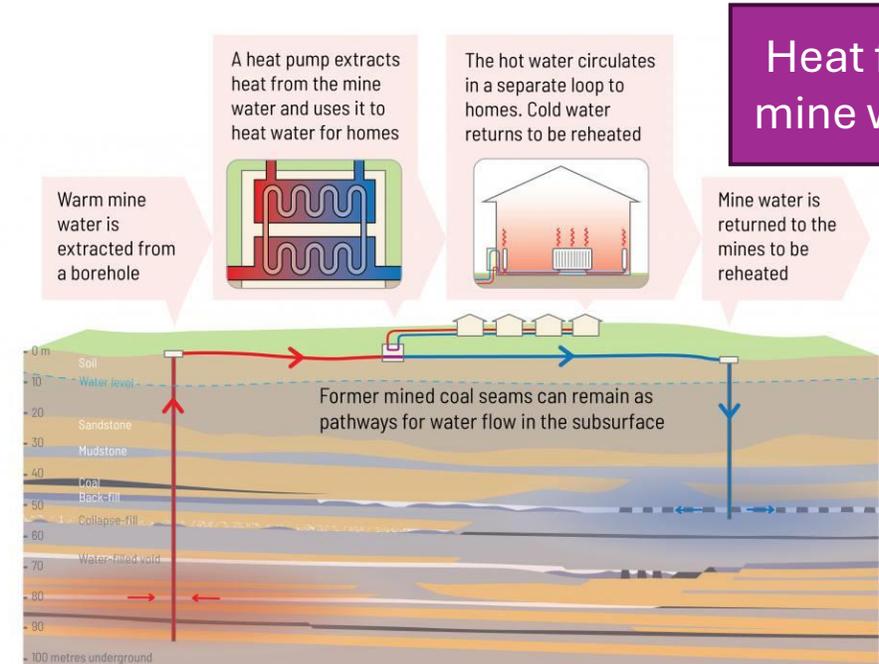

<https://queenstownplumbing.co.nz/>

Air source heat pump

<https://greenerenergygroup.co.uk/>

Heat from mine water

<https://www.bgs.ac.uk/>

Alternative heat resources

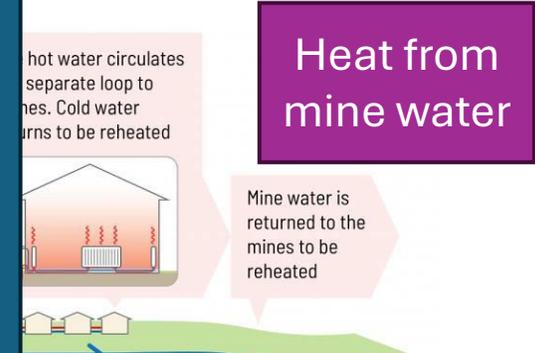

Water source heat pumps (rivers, ponds, wastewater)

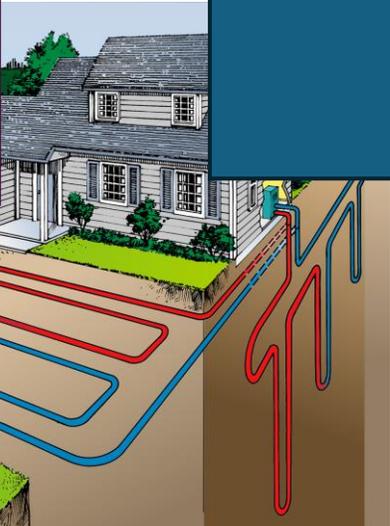

Solar thermal

Thermal energy storage
E.g., Mine water can be used as a thermal energy store. Needed to help balance timing in heat availability and demand (day/night) (summer/winter)

Heat from mine water

Ground source heat pump

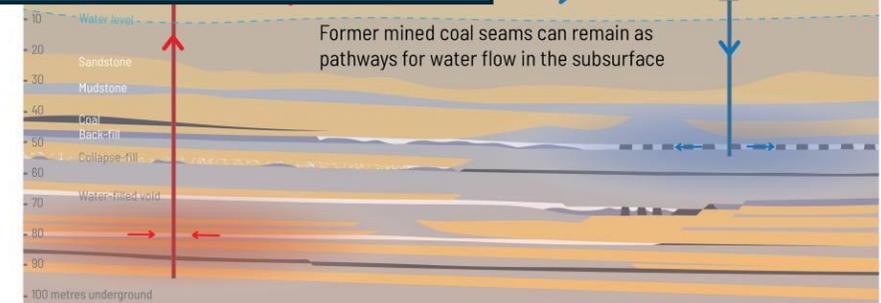

<https://queenstownplumbing.co.nz/>

Ground source heat pump

Meeting heat demand now/in the future

Some of the LHEES indicative heat network zones may struggle to find sufficient resources. Could neighbouring heat-rich zones be incorporated to help bridge the gap?

What can we do to assist the heat-poor zones with high levels social deprivation?

...applying EU lessons learnt on 'energy citizenship'....

To help the EU fulfil its promise of a **just and inclusive decarbonization pathway** through sharing and co-creating new knowledge and practices that **maximize the number and diversity of citizens** who are willing and able to contribute to the energy transition.

Horizon 2020, Jun 21 – Sep 24

Leader of WP4: Identification of citizen clusters for decarbonization

ENCLUDE data framework for clustering citizens

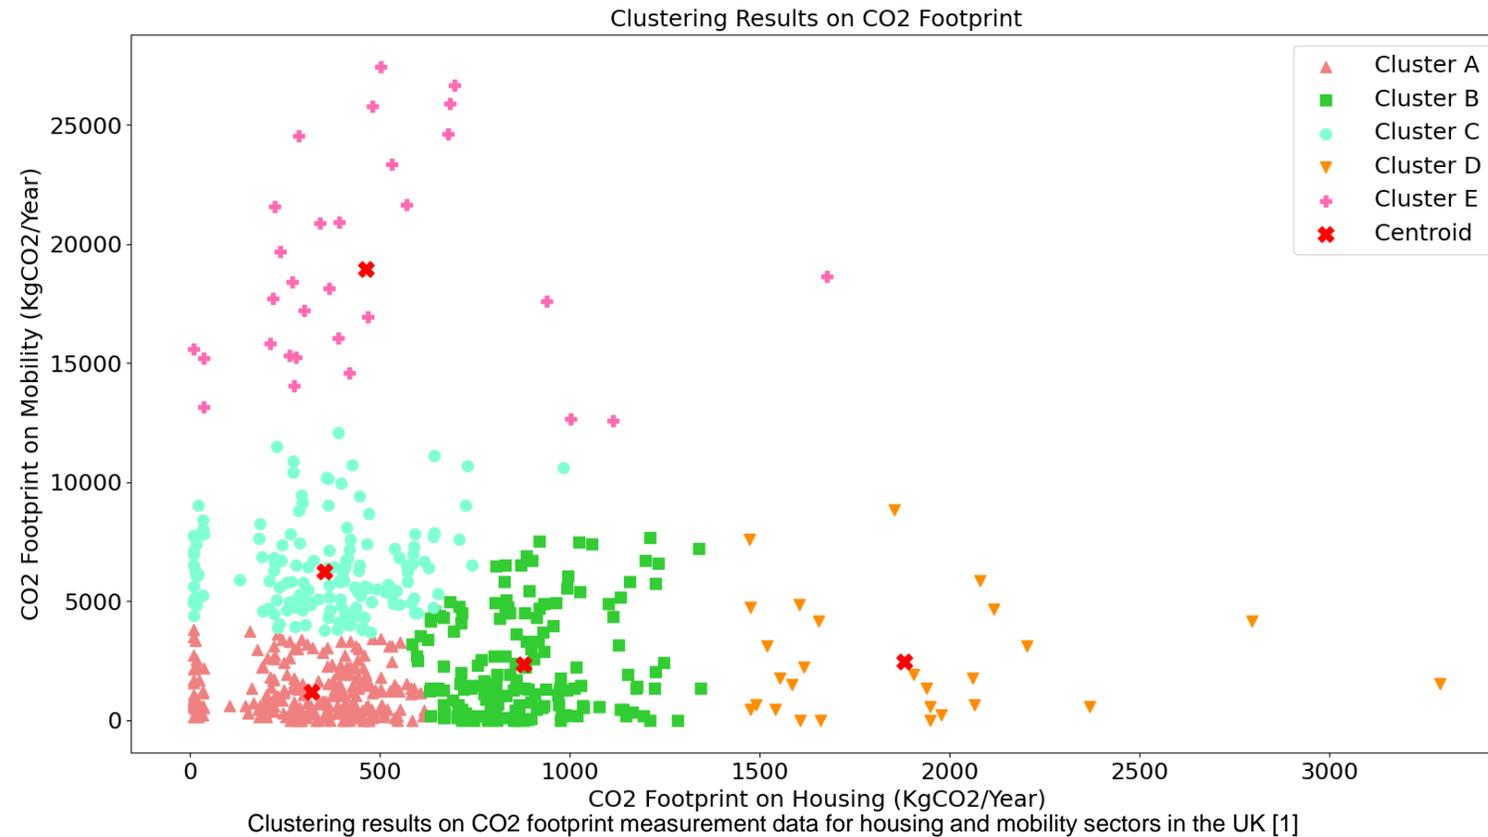

ECHOES dataset

K-means clustering method for clustering citizens based on carbon footprint – Results for ECHOES dataset – UK

Clusters result for CO2 footprint measurement data for the housing and mobility sectors in the UK [1]

Cluster	Population	Centroid location on housing CO ₂ footprint (kgCO ₂ /year)	Centroid location on mobility CO ₂ footprint (kgCO ₂ /year)
A	247	320.63	1180.30
B	161	878.96	2343.67
C	157	352.97	6234.85
D	27	1881.56	2475.36
E	30	463.25	18935.05

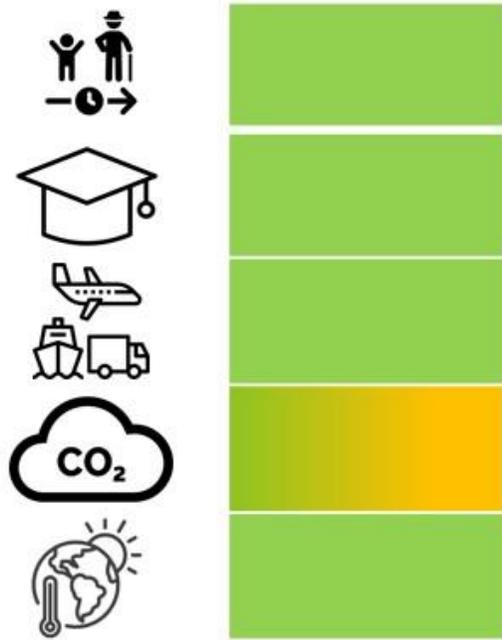

Profile results for CO2 footprint clustering based on within-cluster statistics for the UK [2]

	Profile #1	Profile #2	Profile #3
Age range	19-34	>65	35-49
Education	College	College	College
Population %	64.95%	30.22%	4.82%
Energy on Mobility	Low	Low to medium	High
CO ₂ Emissions (housing and mobility)	Low	Medium to high	High
Climate Change Perception	positive	Neutral to positive	Neutral to positive

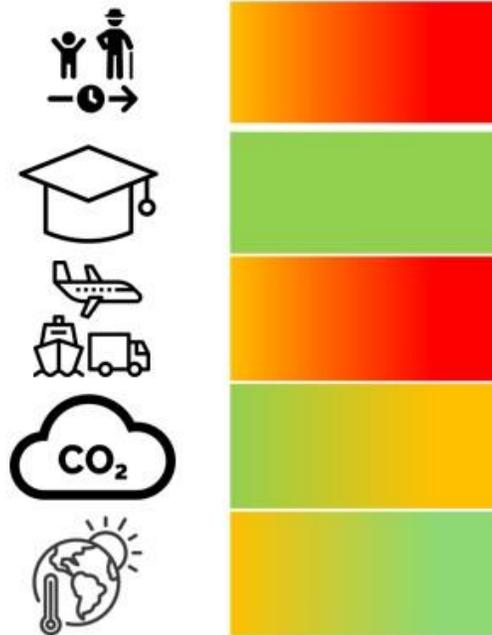

Profile development for citizens based on clustering results of CO2 emission for ECHOES dataset – UK

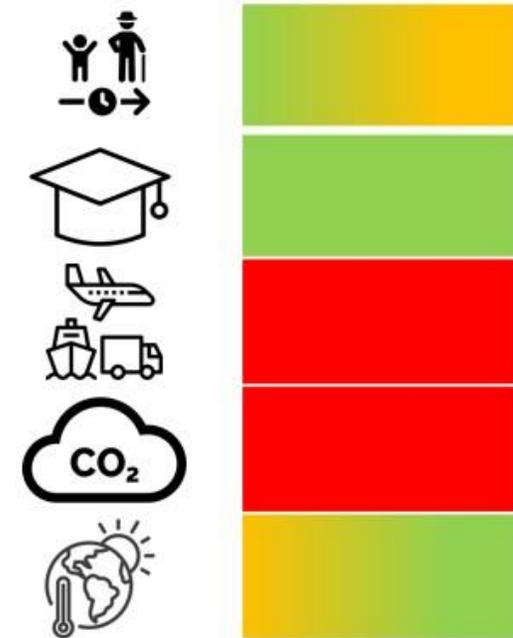

Profile #1

Profile #2

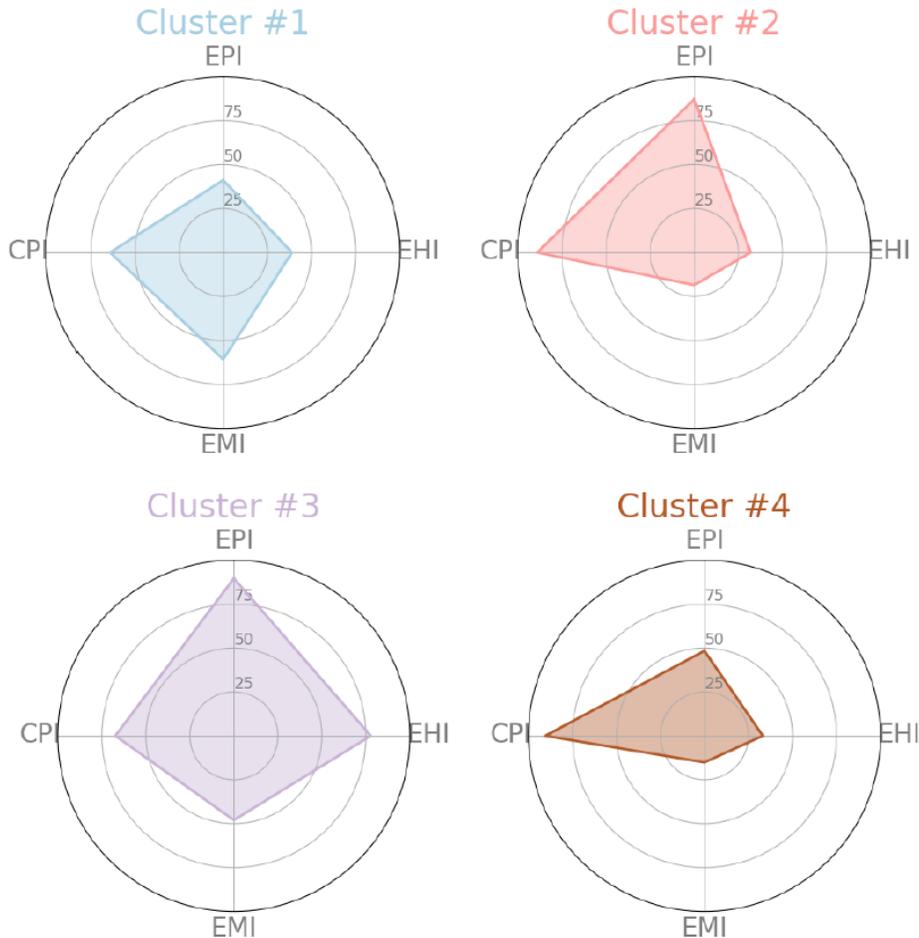

Profile #3

Energy citizens profiles based on clustering results and within-cluster statistics for the UK [1]

Clustering based on Energy poverty, Mobility, Housing, and Climate Change Perception Indices – ENCLUDE data (non-UK)

Spider plots of index-based clustering results for each of the four clusters [1]

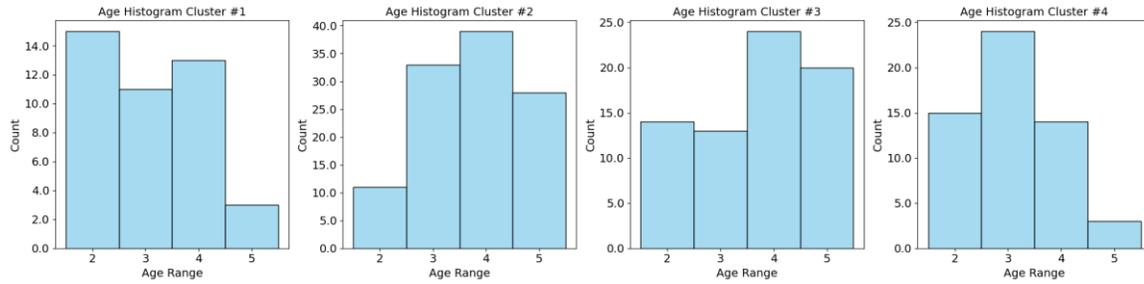

- Clustering ENCLUDE data via defined indices based on answers to questions in 4 categories: **Energy poverty, Mobility, Housing, and Climate Change Perception** [1].
- The aim is to calculate indices for each category using simple addition of answers which are mapped into meaningful numbers.
- 4 indices are defined (rescaled to 0-100) for each respondent based on relevant questions to each index [1].
- k-mean clustering method is applied to the full data set

Cluster	Population	Energy Poverty Index	Energy Housing Index	Energy Mobility Index	Climate Perception Index
1	111	41.12	39.08	60.80	64.28
2	76	87.22	31.98	18.57	89.18
3	54	89.62	77.81	47.99	67.37
4	42	48.37	33.18	15.10	90.47

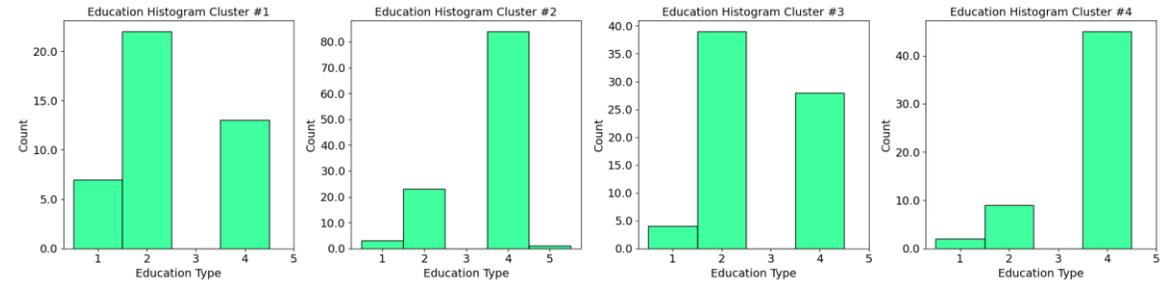

Within-cluster statistics

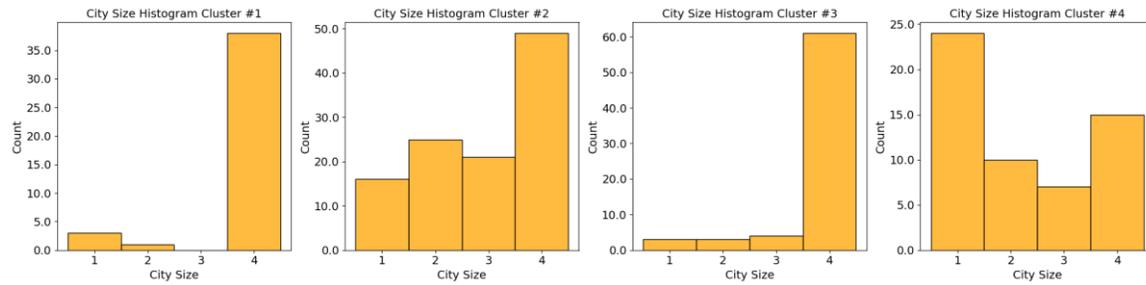

Age

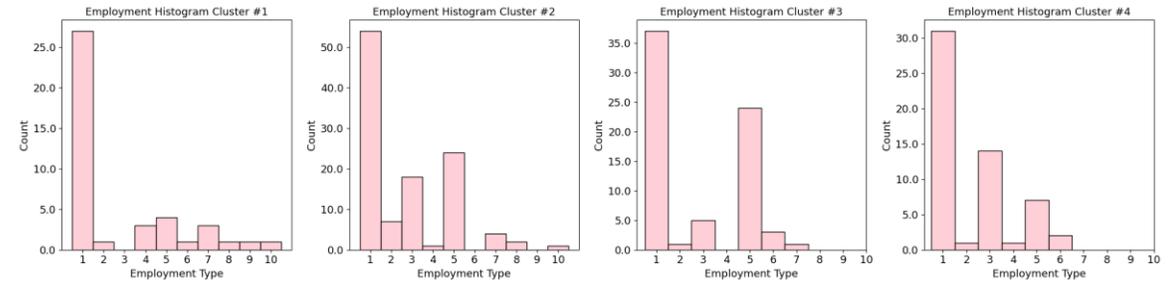

Education

City Size

Employment status

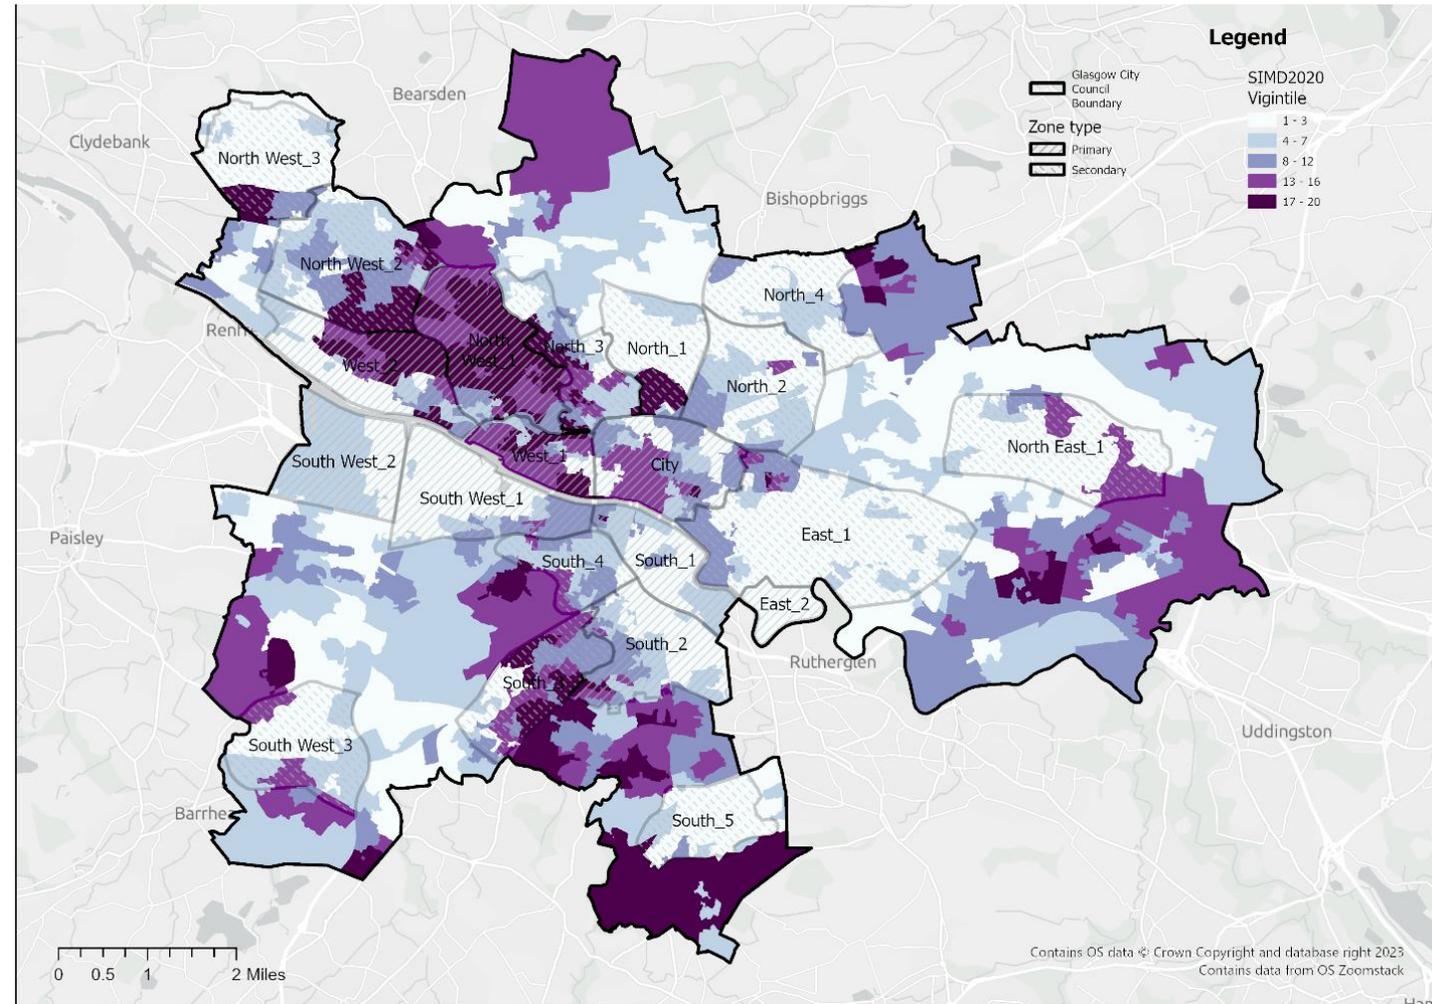

Applying clustering learnings to Glasgow

Vigintile distribution of overall SIMD 2020 rank for Glasgow showing the LHEES indicative heat network boundaries.

The most deprived areas are shown in lighter shades, with the least deprived areas represented by darker colours.

Extending the heat network zones further to capture a greater number of cluster 1-3 postcode areas would allow benefit to be more widespread.

Less than half of the cluster 5 postcodes fall within the indicative heat network zones, but properties in these areas are the greatest domestic users of energy and will therefore provide the greatest per household benefit to emissions reduction targets by going green.
